APPLICATION FOR WAIVER OF SOILS TESTING FOR MINOR ADDITIONS TO ONE AND TWO FAMILY DWELLING UNITS

GENERAL INFORMATION:

Project Address: _____ Application #: _____

Applicant Name: _____ Phone #: _____

BACKGROUND: Historically, quantifiable data has been created using accepted soil science methodologies by approved agencies using approved methods indicating that, in general, the soil conditions likely to be encountered throughout the City of San Luis Obispo would consist of expansive, compressible, shifting or other questionable soil characteristics. These types of soil conditions would require a complete geotechnical evaluation for moderate and major projects.

PURPOSE: To aid in alleviating the burdens of time and disproportionately high cost associated with obtaining soils testing for minor residential additions up to 500 square feet to one and two family dwellings, the City of San Luis Obispo Building Division has developed a policy allowing a waiver of the soils testing as specified in the California Residential Code Section R401.4.

POLICY STATEMENT: Where soils testing has not been previously provided in accordance with the 2016 CRC Section R401.4; one and two family dwelling unit residential attached additions of 500 square feet or less, up to two stories (addition footprint area), may forego soils testing provided, the applicant agrees to have a licensed Design Professional inspect and confirm by signature and design professional's stamp the following checked statements have been investigated and the property is in conformance with these statements;

- An on-site investigation has revealed no foundation failure of the existing residence.
- The type of construction proposed meets or exceeds the minimum provisions for wall and roof-ceiling construction in accordance with the 2016 CRC Chapters 6 and 8.
- The foundation system proposed meets or exceeds the minimum requirements in accordance with the 2016 City of San Luis Obispo Construction and Fire Code Amendments Table 1809.7.
- A minimum allowable soil bearing pressure of 1500 PSF has been utilized for the design of foundation systems as shown in the 2016 CRC Table R401.4.1.
- The proposed area of work on the site does not exceed a maximum 20% slope.
