Carbon monoxide is an odorless, colorless gas created when fuels (such as gasoline, wood, coal, natural gas, propane, oil, and methane) burn incompletely. In the home, heating and cooking equipment that burn fuel are potential sources of carbon monoxide. Vehicles or generators running in an attached garage can also produce dangerous levels of carbon monoxide.

- CO alarms should be installed in a central location outside each sleeping area and on every level of the home. For the best protection, interconnect all CO alarms throughout the home. When one sounds, they all sound.

- Follow the manufacturer’s instructions for placement and mounting height.

- Choose a CO alarm that is listed by a qualified testing laboratory.

- Call the fire department’s non-emergency number when the CO alarm sounds. (805)781-7317, Opt. 1

- Test CO alarms at least once a month; replace them according to the manufacturer’s instructions.

- If the audible trouble signal sounds, check for low batteries. If the battery is low, replace it. If it still sounds, call the fire department.

- If the CO alarm sounds, immediately move to a fresh air location outdoors or by an open window or door. Make sure everyone inside the home is accounted for. Call for help from a fresh air location and stay there until emergency personnel declare that it is safe to re-enter the home.

- If you need to warm a vehicle, remove it from the garage immediately after starting it. Do not run a vehicle or other fueled engine or motor indoors, even if garage doors are open. Make sure the exhaust pipe of a running vehicle is not covered with snow.

- A generator should be used in a well-ventilated location outdoors away from windows, doors and vent openings.

- Gas or charcoal grills can produce CO — only use outside.
